Service Intervals

Some car manufacturers recommend service intervals from 10,000 kms even up to 20,000 kms, but this is often reduced under certain conditions.

We generally recommend more frequent servicing, depending on factors such as vehicle age and driving conditions. Apart from the benefits of changing the oil, regular servicing allows us to identify safety concerns and replace any worn items before they cause major damage.

REASONS FOR CHANGING ENGINE OIL

- By-products of combustion, particularly when the engine is cold, cause sludge build up in the oil, which can block oil galleries and starve moving parts of lubrication.
- Dilution from Fuel will make the oil thinner and reduce its lubricating properties.
- Metal deposits from moving components, builds up in the oil and accelerates wear.

Regular servicing - using a top quality lubricant - reduces the effect of these problems, and greatly increases the life of your engine. It will also improve fuel economy, increase performance, and provide your vehicle in a safe and reliable condition.
